# 2.1. RMQ (static)

Dado un arreglo y una operación asociativa *idempotente*, get(i, j) opera sobre el rango [i, j). Restricción: LVL  $\geq$  ceil(logn); Usar [ ] para llenar arreglo y luego build().

```
1 struct RMQ{
     #define LVL 10

     tipo &operator[](int p){return vec[0][p];}
     tipo get(int i, int j) {//intervalo [i,j)
       int p = 31-__builtin_clz(j-i);
       return min(vec[p][i],vec[p][j-(1<<p)]);</pre>

     void build(int n) {//O(nlogn)
